Task Analysis Guide

Lower-level demands	Higher-level demands
Memorization	Procedures with connections
 Involve either reproducing previously learned facts, rules, formulas, or definitions or committing facts, rules, formulas, or definitions to memory Cannot be solved by using procedures, because a procedure does not exist or because the time frame in which the task is being completed is too short to use a procedure Are not ambiguous. Such tasks involve exact reproduction of previously seen material, and what is to be reproduced is clearly and directly stated. Have no connection to the concepts or meaning that underlies the facts, rules, formulas, or definitions 	 Focus students' attention on the use of procedures for the purpose of developing deeper levels of understanding of mathematical concepts and ideas Suggest, explicitly or implicitly, pathways to follow that are broad general procedures that have close connections to underlying conceptual ideas as opposed to narrow algorithms that are opaque with respect to underlying concepts Usually are represented in multiple ways, such as visual diagrams, manipulatives, symbols, and problem situations. Making connections among multiple representations helps develop meaning. Require some degree of cognitive effort. Although general procedures may be followed, they cannot be followed mindlessly. Students need to engage with conceptual ideas that underlie the procedures to complete the task
being learned or reproduced	successfully and that develop understanding.
 <u>Procedures without connections</u> Are algorithmic. Use of the procedure is either specifically called for or is evident from prior instruction, experience, or placement of the task. 	 <u>Doing mathematics</u> Require complex and nonalgorithmic thinking – a predictable, well-rehearsed approach or pathway is not explicitly suggested by the task, task instructions, or a worked-out example
• Require limited cognitive demand for successful completion. Little ambiguity exists about what needs to be done or how to do it.	 Require students to explore and understand the nature of mathematical concepts, processes, or relationships Demand self-monitoring or self-regulation of one's own cognitive processes
 Have no connection to the concepts or meanings that underlies the procedure being used 	 Require students to access relevant knowledge and experiences and make appropriate use of them in working through the task
• Are focused on producing correct answers instead of on developing mathematical understanding	• Require students to analyze the task and actively examine task constraints that may limit possible solution strategies and solutions
• Require no explanations or explanations that focus solely on describing the procedure that was used	• Require considerable cognitive effort and may involve some level of anxiety for the student because of the unpredictable nature of the solution process required
